Search for date			x
Create service			x
Delete service			x
Update Myervice			x
Display service			x
Search for services			x
Add different categories			x
Styling			x
Alert that service was created, routing to profile			x

By today we should have implemented the following tasks: The search for different services is working at the moment. The results are displayed in a table yet. What we have to do is route the search results on a new page and display them properly.

We generated different categories - Food and Drink, Werbung, Licht und Bühne and Musik. By clicking on those categories you are routed to the services which are filtered by said category. The styling in the categories is done.

We opted for a clear header and with mat-cards and ngFor we generated good looking and clean

search results. When in a category you can search again. The category is already fixed - but you can search for a price or a location.

You cannot update your service yet - but that should be implemented by next week.

We decided that we want to delete the date Input as we want to add a date only to the booking request but not in the search results already. It would have been too complicated with calendars etc.

Alerts are not yet generated when service is created that has to be implemented as well.

We also realized that with Authentication - which should have been finished already some weeks ago - we have to implement different guards. Kerrie is working on this.

In the backend everything is running smoothly. They respond to requests we have in the frontend quickly and Julian sometimes also have a look in the frontend code when communication with backend doesn't function as planned.

The alerts aren't functioning yet when registered or logged in. That has to be implemented as well. Said is working on the updating of the profile and also on the deleting as well as the display of the registration information.

We also added a page for my services - where you see which services you added. There you should be able to delete the service as well. This needs to be implemented, but that shouldn't take too long.

We still have many things to do. The overview we did in the beginning isn't as detailed as we would have liked it to be. While coding we realized what everything should also be implemented and what doesn't work, what does and where we need to invest more time than planned.

At the moment we aren't too concerned with styling but we need to start with that -as the first impression is everything.

Overall we still have a lot of work to do. But hopefully it'll work out fine in the end.
