First Meeting - 2. October 19

Requirement Collection

In our meeting we collected the requirements for the Authentication and Authorization Part of our **first** Milestone.

Requirements USER LOGIN

For the registration every user needs to put in their full name, pick a username, password email address. It has to be clear after registration if user is a service provider or end user. The UI of a service provider / end user has to differ, but all in all no preferences regarding interface.

After registration, user can add more details to his user profile.

Email address should be checked to see if it is a valid mail address. Passwords should be hashed. The website should support approximately 100 different users.

It should be made sure, that spam users are blocked. An admin should decide if a user registration should be accepted or not. Random data and usernames should be forbidden.

The admin should have access to all date and has an own user account.

(Tipp: implement authentication on express via angular)

Requirements AFTER LOGIN

The website (after login) should look differently depending on whether you're a service provider or an end user.

Deadline

23. October 2019.

Comments

The next two days should be used to get an overview for the upcoming tasks. And maybe jot down some ideas how to start, whether we'd want to use the Scaffolding or start from scratch.

By **Saturday** everyone should know what the project is about, whether you'd want to be in front-end or back-end. By then, we should set **some goals and tasks** for the next week and start programming. Whether Kerrie will still be part of the team or not (overlapping lectures) is yet to be defined. The Overview for the Project after discussing

what we should have implemented by the end of the project should be created next week.

We should decide between Angular or Ionic for Frontend by the weekend.
