Review Project Overall - 9. Dezember
Deadline tomorrow 10. Dezember 2019

What is still missing and what has to be implemented by tomorrow
- Deny by booking requests broke after merge yesterday. Has to be rebuilt.
- Rating doesn't work properly yet - but is just a minor bug
- The input for password in registration isn't controlled yet.
- Dates should be deleted as we only implement them when booking a service
- Profile of Admin - all input fields are empty. Should we add something there?
- Price when creating a service should be checked that it is a number
- Add overall styling - Homepage with Kerrie is different than on computer of Annina. Add percent and not pixels in css.

We still have to add some things tonight, but everything else works fine.

What is good
The logic of the site works. You can register, you can login/logout. We added the CRUD operations for datamanagrement to our services and the user profiles.
Navigation on site is quite intuitively and straight-forward. The page is simple, minimal and clean and you understand what it is about. Maybe start with an introduction of what we are - as it can be a little bit confusing if starting just with a search field and not knowing anything about the page.

What we could improve next time
Communication and Time Management were probably the greatest issues we had. As everyone is elsewhere occupied with work/other lectures/leisure activities, working together on the project was found difficult.
Sketches in the early phase and prototypes and earlier usability tests would probably have improved our code and showed us problems earlier.
We just have a running desktop version now - but what about the mobile view? We didn't implement that properly as we were too occupied with the not functioning logic of our site. Next time we should implement the mobile view as well.
Also in regards of styling: The home page is nice. But also a little bit boring. We could've made it fancier, maybe added more pictures and/or carousels of customer reviews.
The review part of bookings could've been expanded as well but we had not enough time for that.

Overall

We learned a lot in the past couple of weeks and we think having such a project running next to uni was fun - as it was really something we made ourselves. We learned how hard it can be working in a team but also how rewarding - as everyone adds different insights on problems. We gained a lot of knowledge how a web page should be organized and how usability can be improved. When searching on different websites now, we realize faster what is good on that site and what bad.

We learned how to solve problems without having a professor or assistant next to us - but in our teams and also our good friend google.

I think the whole project gave our team more self-confidence in programming, but also motivates going further into web development.
